

Survey on AI skills and competences

The EU-funded AI4VET4AI project is conducting a survey to find out how artificial intelligence can be used to improve the modern workplace. The main objective of the project is to examine how Vocational and Educational Training (VET) systems in 11 EU Member States can contribute to preparing the workplace for the future. VET is a type of education that prepares people for specific professions, trades or areas of expertise, with an emphasis on the acquisition of practical skills that are directly applicable in the workplace.

The survey is designed to collect information on organisations working in the field of Vocational Education and Training (VET). The aim of the survey is to obtain information on the whole school, training establishment or company that provides or supports VET. Participants can be people working in these organisations or responsible for human resources or production processes that employ individuals with VET qualifications. The data collected will help us to better understand the current situation and the challenges in the VET field and to develop guidelines to improve the preparation of workplaces for the future.

Thank you in advance for your participation.
